1. Project Overview

Project name: Seekra marketing website (the public "product face").

Objective: Design and build a modern, corporate, professional single-page marketing website for **Seekra**, a self-hosted, content-aware AI document intelligence platform. The site will be the primary marketing asset for two target markets: the **Gulf region** (enterprise/government buyers who care about data sovereignty) and **Pakistan** (enterprises and organizations needing bilingual English/Urdu/Arabic document AI).

Design ambition: An Apple.com-class scrolling experience — cinematic, spacious, confident — without copying Apple. The page should keep visitors engaged as they scroll: a strong animated hero, alternating dark and light chapters, subtle scroll-reveal motion, and honest product storytelling.

Deliverable expected from the build: A production-ready responsive website (desktop + mobile), English first (Arabic version planned later), deployable as static files.

Hosting plan (context for the builder): The marketing site will live at the domain root `seekra.pk`; the actual web application will move to `app.seekra.pk`. The site must therefore work at a domain root and keep the "Launch App / Book a Demo" links configurable.

2. The Product: What Seekra Does

Seekra is a **Content-Aware Intelligence** platform: organizations upload their documents, and Seekra lets staff ask questions, search by image, and even talk to their archive — with answers grounded in the organization's own files and cited back to the exact source page. It is fully **self-hosted**: nothing leaves the customer's infrastructure.

2.1 Core capabilities (the story the site must tell)

Table 1 Seekra capability pillars

Pillar	What it does	Why it matters to buyers
Ask (Conversational Q&A)	Chat with the entire document archive in natural language. Every answer carries numbered citation markers that deep-link to the exact source document and page, opening the built-in document viewer at that page.	Answers are verifiable in one click — no blind trust in AI output. Critical for compliance-driven buyers.

See (Visual search)	Upload a photo or scanned image; Seekra finds visually similar items across the archive using image embeddings, shows similarity scores and detected-content labels, and describes what the image most likely shows and which documents it relates to.	Field inspections, damage photos, site images — searchable without any text. A differentiator almost no competitor has.
Speak (Voice, Arabic-first)	Full voice interaction: speech-to-text in, spoken answers out. Arabic is a first-class citizen (including RTL rendering and Arabic-capable fonts), alongside English and Urdu.	Built for the Gulf and Pakistani markets where Arabic/Urdu support in enterprise AI is rare and shallow.
Trust (Security & sovereignty)	Self-hosted on the customer's own servers (cloud VM or air-gapped on-prem). PII is automatically detected and masked before any text reaches an LLM. Role-based access control, full audit logging.	Data never leaves the box — the decisive argument for government, legal, healthcare, and financial buyers.
Read (Built-in Office viewing)	Word, Excel, PowerPoint and PDF files open in an in-browser viewer — no desktop Office install needed, and citations open straight into the viewer at the cited page.	One workspace; no "download and open locally" friction.

2.2 Key differentiators (honest claims only)

- **100% self-hosted** — runs on the customer's infrastructure, including fully air-gapped deployments.
- **PII masking before the LLM** — names, ID numbers, emails, and phone numbers are redacted upstream of any language model call.
- **Cited answers with page-level deep links** — every claim in an answer links to its source page.
- **True multimodal search** — text, image, and voice in one system.
- **Arabic/Urdu/English parity** — not a translated afterthought.

Do not fabricate customer names, logos, statistics, or testimonials anywhere on the site. If proof points are needed, use capability statements only.

3. Target Audience & Markets

Table 2 Audience profile

Segment	Profile	Message emphasis
Gulf enterprises & government	CTOs, CIOs, compliance and digital-transformation leads in KSA/UAE/Qatar. Regulated sectors: government, legal, finance, healthcare, energy.	Data sovereignty, air-gap readiness, Arabic-first voice and UI, audit trails.

Pakistani enterprises	Banks, law firms, industrial groups, public sector. Mixed English/Urdu document estates.	Bilingual parity, visual search for field operations, on-prem deployment, no per-seat SaaS lock-in.
-----------------------	--	---

Primary call to action: *Book a Demo* (contact form + email). Secondary: learn the capabilities by scrolling. No pricing is published — pricing is discussed in person.

Tone of voice: Corporate and professional; confident but never hyped; short declarative sentences; no buzzword stuffing ("revolutionary", "game-changing", "supercharge" are banned).

4. Brand Design System

The website **must** use the same color identity as the Seekra application. These are the exact brand shades — do not substitute them:

Table 3 Official brand palette (mandatory)

Swatch	Hex	Name	Usage
	#3D2B1D	Dark brown	Primary brand color: headings, key surfaces, gradients, section anchors.
	#B59876	Tan / sand accent	Primary accent: CTAs, links, highlights, citation chips, glows, icon strokes.
	#E7E6E4	Cream (light)	Light section backgrounds; body text on dark surfaces.
	#D8D6D3	Warm gray	Secondary light backgrounds, borders, muted text on dark.
	#202020	Charcoal	Dark section base (hero, security, contact, footer).
	#B93C32	Brick red	Sparing accent only: a period in a headline, "not supported" marks in comparison tables. Never a background.

4.1 Typography

- **Primary typeface:** Inter (self-hosted variable font preferred) — clean, corporate, excellent screen rendering.
- **Display headings:** 600–650 weight, tight letter-spacing (-0.02em to -0.03em), large scale (Apple-like restraint: one big idea per screen).
- **Body:** 400–450 weight, comfortable line-height (~1.6).

- Arabic text (used in small accent chips such as "اردو · العربية · English") must render with proper shaping; include a Nastaliq/Naskh-capable font fallback for Urdu/Arabic snippets.

4.2 Visual language rules

- **Backgrounds are solid.** No grid-line patterns, no square-box textures, no busy tech patterns. Depth comes from soft radial glows (tan on charcoal/brown) and generous whitespace.
- **Rhythm:** alternate dark and light chapters as the visitor scrolls (dark hero → light problem/capabilities → dark security wall → light comparison/deployment → dark contact/footer).
- **Motion:** subtle scroll-reveal (fade + slight rise, staggered), slow crossfade/Ken-Burns on hero visuals. Motion must be calm — no parallax gimmicks, no autoplaying sound.
- **Product visuals in browser-frame mockups:** UI screenshots/videos sit inside a minimal browser-chrome frame (three dots + URL pill showing `app.seekra.pk`) with soft tan-tinted shadows.
- **Corner radius:** moderate (10–16px on cards/frames); **no heavy shadows**; borders hairline (rgba cream at 8–12% on dark, gray on light).
- **Icons:** thin-stroke line icons only (lucide-style), tan or `currentColor`.

5. Website Structure & Content Requirements

A single-page site with anchored sections, in this order:

Table 4 Page structure (top to bottom)

#	Section	Theme	Content requirements
1	Navbar	dark, fixed	Tan logo mark + "Seekra" wordmark; links: Capabilities, Security, Deployment, Contact; right-side tan pill button "Book a Demo". Transparent at top, frosted dark (<code>#202020</code> at ~85% + blur) after scroll.
2	Hero	dark	Not a wall of solid text. An animated product showcase plays inside a browser frame (auto-crossfading slideshow of 4 scenes: Ask / See / Speak / Trust, ~5s each, slow zoom, caption pill, progress dots). Compact one-line headline above: "Your documents finally <i>answer back</i> ." (tan accent + red period). Floating glass chips around the frame: "Cited answers", "اردو · العربية · English", "100% visual match", "Air-gapped ready". Two CTAs: "Book a Demo" (tan, primary) and "See how it works" (ghost).
3	Problem	light	Three pain cards: (a) knowledge is buried in files nobody can search; (b) cloud AI means your data leaves the building; (c) answers without sources can't be trusted. Empathetic, specific, corporate tone.

4	Capabilities	light (alternating)	Three chapters — Ask, See, Speak — each: headline, 3–4 concrete benefit bullets, and a browser-frame product visual (screenshot/video/animated mock). Alternate left/right layout per chapter.
5	Security wall	dark	Headline: "Nothing leaves the box." (red period). Four cards: Self-hosted & air-gap ready; PII masked before the LLM; Role-based access control; Full audit logging. This section is the emotional climax for Gulf buyers — give it weight.
6	Comparison	light	Honest table: Seekra vs. typical Cloud AI assistants — rows: data residency, air-gap option, PII pre-masking, page-level citations, visual/image search, Arabic/Urdu voice, offline operation. Tan check marks for Seekra; red X or "Partial" pills for cloud AI, with a fair footnote (cloud tools are strong for general tasks; the comparison concerns enterprise data handling).
7	Deployment	light	Three cards: Cloud VM (customer's AWS/Azure), On-premises, Air-gapped / offline — the featured option styled as a dark #202020 card. No pricing shown anywhere.
8	Contact	dark	Simple form (name, organization, email, message) submitting to rahmirz.consulting@gmail.com via a form backend (e.g., FormSubmit AJAX) with a <code>mailto:</code> fallback. Show the email address visibly as well. No phone/WhatsApp.
9	Footer	dark	Logo, one-line tagline, section anchors, email, "© 2026 Seekra". Minimal.

5.1 Interaction requirements

- Scroll-reveal animations via IntersectionObserver (fade/translate, staggered); must include a ~2.5s fallback so content is never hidden if observers fail.
- Hero slideshow: pure JS/CSS crossfade; pause on user interaction is a plus; must not autoplay audio.
- All anchor navigation smooth-scrolls; navbar collapses to a hamburger on mobile.
- Fully responsive: desktop, tablet, mobile (the hero showcase must stack cleanly below the headline on small screens).

6. Media & Asset Plan

Table 5 Assets

Asset	Status	Notes
Hero showcase visuals (4 scenes)	Available	Four AI-generated 16:9 branded scenes (chat, visual search, voice, security) exist and will be supplied as JPGs. They may be replaced later by real screen recordings.

Product videos (3–4 clips)	To be recorded	Real screen recordings will be captured later: (1) chat question → citation → source page opens; (2) visual search flow; (3) Urdu/Arabic voice interaction; (4) optional Office viewer. The build must make video slots easy to swap (a <code>video</code> source per frame).
Logo	To be supplied	Until then, render the wordmark as text: "Seekra" in cream with a tan geometric mark (e.g., magnifier/dot motif).
Photography	None	No stock photos required; product visuals carry the page.

A short "small video clip that tells about Seekra" is desired for the hero once recordings exist — the design should treat the hero frame as video-ready (muted autoplay loop, `playsInline`).

7. Technical Requirements & Constraints

- **Stack (preferred):** React + TypeScript + Vite + Tailwind CSS, producing a static build (`dist/`) that can be served by any web server. A well-structured plain HTML/CSS/JS build is also acceptable if equally polished.
- **No backend required** for the site itself. The contact form uses a form-to-email service (FormSubmit endpoint: `https://formsubmit.co/ajax/rahmirz.consulting@gmail.com`) with graceful `mailto:` fallback and clear sending/sent/error states.
- **Fonts self-hosted** (no Google Fonts CDN dependency at runtime preferred).
- **Performance:** optimized images (progressive JPEG/WebP, <250KB each), lazy-load below-the-fold media, no heavy animation libraries required for the current scope (IntersectionObserver + CSS transitions suffice).
- **SEO basics:** title "Seekra — Content-Aware Intelligence for the Enterprise", meta description, Open Graph tags, semantic HTML, descriptive alt text.
- **Accessibility:** sufficient contrast in both themes, focus states, reduced-motion media query honored.
- **Deployment target:** static files behind nginx at the domain root; all asset paths relative; no client-side router needed (single page, hash anchors only).
- **Internationalization:** English first; keep copy centralized (single config/content file) so an Arabic (RTL) version can be added later without restructuring components.

8. Competitive Positioning

Seekra competes with cloud AI assistants (ChatGPT/ Copilot-style tools) and enterprise search products. The positioning line for the Gulf and Pakistani markets:

Cloud AI assistants are excellent generalists — but they ask you to hand them your documents. Seekra brings the intelligence to your documents instead: it runs entirely on your infrastructure, masks personal data before any model sees it, and proves every answer with a citation you can open.

The site must communicate this without disparaging competitors: the comparison table stays factual (data residency, citations, visual search, offline capability), and a footnote acknowledges cloud tools' strengths for general-purpose work.

9. Copy Deck (Approved Messaging)

The following copy points are approved and should appear (or be closely paraphrased) on the site:

- **Hero headline:** "Your documents finally answer back."
- **Hero subline:** "Seekra is content-aware intelligence that runs entirely on your infrastructure. Ask, see, and speak to your archive — every answer cited to its source."
- **Primary CTA:** "Book a Demo" · Secondary: "See how it works".
- **Security headline:** "Nothing leaves the box."
- **Capability labels:** Ask — answers with citations · See — search by image · Speak — Arabic, اردو, English · Trust — nothing leaves the box.
- **Contact heading:** "See Seekra on your own documents." Supporting line: "Tell us about your archive and we'll arrange a live demo." Email: rahmirz.consulting@gmail.com.

10. The AI Build Prompt (Copy-Paste Ready)

Paste the prompt below into your chosen AI platform to generate the website. It is self-contained; attach the four showcase JPGs and (when available) the product videos as assets.

You are an expert front-end designer and developer. Build a complete, production-ready, single-page marketing website for "Seekra", a self-hosted AI document intelligence platform. Deliver a responsive static site (React + TypeScript + Vite + Tailwind preferred; equivalently polished plain HTML/CSS/JS is acceptable). Do not ask me questions – make sensible decisions and build the whole thing.

PRODUCT CONTEXT

Seekra is a "Content-Aware Intelligence" platform. Organizations upload their documents; staff then chat with the archive and get answers with numbered citations that deep-link to the exact source document and page (opened in a built-in viewer for PDF/Word/Excel/PowerPoint). It also supports visual search (upload an image, find visually similar documents with similarity scores and detected-content labels) and full voice interaction that is Arabic-first, with Urdu and English parity. Everything is self-hosted – cloud VM, on-prem, or fully air-gapped. PII (names, IDs, emails, phone numbers) is automatically masked before any text reaches an LLM. Role-

based access control and full audit logging are built in. Target buyers: enterprises and government in the Gulf region and Pakistan. Never fabricate customer logos, statistics, or testimonials.

MANDATORY BRAND PALETTE (use exactly these, no substitutes):

- #3D2B1D dark brown – primary brand color, headings, gradients
- #B59876 tan – primary accent: CTAs, links, highlights, chips, glows
- #E7E6E4 cream – light section backgrounds; body text on dark
- #D8D6D3 warm gray – secondary light backgrounds, borders, muted text
- #202020 charcoal – dark section base (hero, security, contact, footer)
- #B93C32 brick red – sparing accent only (a period in a headline, X marks in the comparison table); never a background

DESIGN LANGUAGE

- Corporate, professional, Apple.com-class polish: cinematic spacing, one big idea per screen, calm motion. Do NOT copy Apple.
- Backgrounds are SOLID. Absolutely no grid-line patterns, no square-box/dot-matrix textures. Depth comes only from soft radial tan/brown glows on dark sections and generous whitespace.
- Rhythm: alternate dark and light chapters (dark hero → light problem/capabilities → dark security → light comparison/deployment → dark contact/footer).
- Typography: Inter (self-hosted variable font), headings 600–650 weight with tight tracking (-0.02em), body 400–450. Arabic/Urdu accent text (e.g. "العربية · اردو · English") must render with correct shaping.
- Product visuals sit inside a minimal browser-chrome frame (three dots + URL pill reading "app.seekra.pk"), moderate radius (10–16px), soft tan-tinted shadow, hairline borders.
- Motion: subtle scroll-reveal via IntersectionObserver (fade + slight rise, staggered) with a ~2.5s fallback that reveals everything if observers fail; slow crossfade slideshows; honor prefers-reduced-motion; no autoplay audio; no parallax gimmicks.
- Icons: thin-stroke line icons only (lucide style).

PAGE STRUCTURE (single page, anchored sections, in this order):

1. Fixed navbar (dark): tan logo mark + "Seekra" wordmark; links Capabilities / Security / Deployment / Contact; tan pill button "Book a Demo". Transparent at top, frosted #202020/85 + backdrop blur after scroll; hamburger on mobile.
2. HERO (dark): Do NOT make this a solid text hero. Centerpiece is an animated showcase inside a browser frame: an auto-crossfading slideshow of 4 provided 16:9 scenes (chat.jpg, visual.jpg, voice.jpg, security.jpg – supplied as assets), ~5s per scene with a slow Ken Burns zoom, a caption pill at the bottom cycling "Ask – answers with citations", "See – search by image", "Speak – Arabic · اردو · English", "Trust – nothing leaves the box", plus clickable progress dots. Above the frame, a compact one-line headline: "Your documents finally answer back." with "answer back" in #B59876 and the period in #B93C32. Subline: "Seekra is content-aware intelligence that runs entirely on your infrastructure. Ask, see, and speak to your archive – every answer cited to its source." Floating frosted-glass chips around the frame: "Cited answers", "العربية · اردو · English", "100% visual match", "Air-gapped ready". CTAs: "Book a Demo" (solid #B59876, text #202020) and "See how it works"

(ghost, scrolls to capabilities). Make the frame video-ready: it must accept a muted

autoplay looping

11. Acceptance Checklist

Use this checklist to review whatever the AI platform produces:

1. Exact palette used (#3D2B1D, #B59876, #E7E6E4, #D8D6D3, #202020, #B93C32) — no foreign accent colors.
2. Backgrounds solid; no grid/square/dot patterns anywhere.
3. Hero plays the animated 4-scene showcase in a browser frame — not a solid text hero.
4. All nine sections present, in the specified order, with dark/light rhythm.
5. Red used only sparingly (headline period, comparison X marks).
6. Contact form delivers to rahmirz.consulting@gmail.com with mailto fallback; email visible on page.
7. No pricing, no fabricated customers/stats/testimonials.
8. Mobile layout verified; scroll-reveal fallback works with JavaScript observers disabled.
9. Copy centralized for the future Arabic RTL version.
10. Video slots swappable without code restructuring.
