EXECUTIVE SUMMARY

One platform. Your entire archive. **Nothing** leaves the building.

Seekra is a content-aware intelligence platform that gives your organization a private assistant for its documents. Seekra runs in three deployment tiers - from **cloud-native** (using industry-leading external AI models with PII masking) to fully **self-hosted** and **air-gapped**. Organizations upload their documents - contracts, policies, case files, scanned images, field photographs - and Seekra lets their staff ask questions in natural language, search by image, and speak to the archive in Arabic or English.

Every answer carries numbered citations that link directly to the exact source page. Personal information is automatically masked before any AI model is involved. Role-based access controls and a complete audit trail make Seekra suitable for the most regulated Gulf environments - across all three deployment tiers.

ASK

Conversational Q&A with citations
citations

SEE

Search the archive with a
photograph

SPEAK

Arabic-first voice interaction

TRUST

Self-hosted. Nothing leaves the
the box.

Three problems every large archive suffers from

01

Knowledge buried in files

Critical information lives inside thousands of PDFs, scans, and Office documents that no one can effectively search. Staff spend hours locating a single clause, and institutional knowledge walks out the door when experienced employees leave.

02

Cloud AI means data leaves the building

Mainstream AI assistants ask you to upload your documents to their servers. For government, legal, healthcare, and financial work, that is often non-negotiable - the data cannot leave your jurisdiction or your network.

03

Answers without sources can't be trusted

When an AI produces an answer with no link to where the information came from, it cannot be verified. In regulated environments, an unverifiable answer is the same as no answer at all.

THE SEEKRA APPROACH

Bring the **intelligence** to your documents — not the other way around.

Cloud AI assistants are excellent generalists, but they ask you to hand them your documents. Seekra reverses the relationship: the platform runs entirely on your infrastructure, masks personal data before any model sees it, and proves every answer with a citation you can open.

ASK

Conversational Q&A

Chat with the entire archive in natural language. Every answer carries numbered citations that deep-link to the exact source page.

SEE

Search by image

Upload a photo or scan; Seekra finds visually similar items across the archive with similarity scores and detected-content labels.

SPEAK

Arabic-first voice

Full voice interaction with Arabic as a first-class citizen, alongside English. Built for the Gulf.

TRUST

Nothing leaves the box

Self-hosted on your servers, including fully air-gapped. PII masked before any AI. Role-based access and full audit logging.

CAPABILITY 01 • ASK

Answers you can verify in one click

Staff type a question in plain language and Seekra responds with an answer drawn from the organization's own documents. Every claim in the response is marked with a numbered citation that links to the exact source document and page, opening instantly in the built-in viewer.

- ✓ Natural-language questions — no query syntax to learn
- ✓ Numbered citations link to the exact source page
- ✓ Built-in viewer opens PDF, Word, Excel, and PowerPoint in the browser
- ✓ Critical for compliance-driven buyers who require verifiable AI

CAPABILITY 02 · SEE

Search your archive with a photograph.

Upload a photo, scanned image, or screenshot, and Seekra finds visually similar items across the entire archive using image similarity. Each result shows a similarity score and a label describing what the image most likely shows, plus the documents it relates to.

- ✓ Field inspections, damage photos, site images — searchable without any text
- ✓ Image-to-image similarity with detected-content labels
- ✓ A differentiator almost no competitor offers
- ✓ Works for scans, photographs, screenshots, and document page images

CAPABILITY 03 • SPEAK

Speak to your archive. In Arabic or English.

العربية

English

Seekra supports full voice interaction — speech in, spoken answers out. Arabic is a first-class citizen, with correct right-to-left rendering and Arabic-capable fonts. English sits alongside it with full parity, not as a translated afterthought.

Speech-to-text in, spoken answers out

Arabic as a first-class citizen — proper RTL rendering

English with full parity — not a translated afterthought

Built for the Gulf market where this combination is rare

Nothing leaves the box.

This is the decisive argument for government, legal, healthcare, and financial buyers. Seekra offers three deployment tiers — **cloud-native, self-hosted, or fully self-hosted, or fully air-gapped** — so you choose exactly where the AI runs and how isolated your environment is. Personal information is automatically automatically detected and masked at the source, and in self-hosted and air-gapped deployments the AI model itself runs locally on your own servers — no data own servers — no data and no model ever leave the box.

Three deployment tiers

Cloud-native, self-hosted, or fully air-gapped. You choose where the AI runs and how isolated your environment is.

PII masked at the source

Names, ID numbers, emails, and phone numbers are automatically automatically redacted before any AI call. Critical for the cloud-native native tier where AI runs externally; preserved across all tiers.

Role-based access control

Granular permissions: administrators, editors, viewers, and read-only read-only auditors. Collections can be restricted to specific users. users.

Full audit logging

Every security-relevant action is logged with actor and detail — logins, logins, password resets, file events, permission grants. Forensically Forensically reconstructable.

HOW SEEKRA COMPARES

An honest comparison.

Cloud AI assistants are strong for general-purpose work. The comparison below concerns enterprise data handling — where Seekra is purpose-built.

Capability	Seekra	Typical Cloud AI
Data residency inside your infrastructure	✓ Yes	✗ No
Air-gapped / offline option	✓ Yes	✗ No
PII masked at source	✓ Yes	Partial
Page-level citations to source	✓ Yes	Partial
Visual / image search	✓ Yes	Partial
Arabic voice (first-class)	✓ Yes	Partial
Offline operation	✓ Yes	✗ No

Cloud AI tools are excellent generalists. This comparison concerns enterprise data handling, sovereignty, and verifiable answers — not general-purpose assistant quality.

DEPLOYMENT

Three tiers. One platform. You choose

Seekra runs in three deployment tiers - from cloud-native to fully air-gapped - so you choose exactly where the AI runs and how isolated your environment is. The platform stays the same; only the AI location and network exposure change.

TIER 01 · FASTEST

Cloud Native

Seekra runs in your cloud tenant and can leverage industry-leading external AI models - ChatGPT, Gemini, Claude - with PII automatically masked before any external call. Best AI capability, fastest to deploy.

TIER 02 · SOVEREIGN

Self-Hosted

Seekra runs entirely on your own infrastructure - cloud VM or on-premises servers - with AI models hosted locally. Full data sovereignty. Nothing leaves your network.

TIER 03 · MAXIMUM SECURITY

Air-Gapped

Fully isolated self-hosted deployment with no external network connection. For classified, sovereign, or maximum-security workloads where even update traffic is not permitted.

No pricing is published. Deployment tier and scale are discussed in person during the demo.

USE CASES

Built for the Gulf's most regulated sectors.

Seekra is designed for organizations where data sovereignty, Arabic-first interaction, and verifiable answers are not optional. The use cases below reflect the cases below reflect the buyers we built it for.

Government & Public Sector

Sovereign archives, classified document handling, Arabic-first citizen services, and a complete audit trail for every action.

Legal & Compliance

Case-file Q&A with verifiable citations. Privileged-document isolation through collections. Retention controls and read-only only auditor oversight.

Banking & Financial Services

Policy and contract search across across thousands of documents. Personal information redacted before AI. Regulator-ready audit audit logs.

Healthcare

Patient record Q&A, image-based diagnosticsearch, and on-prem deployment for HIPAA-equivalent data protection rules.

Energy & Utilities

Field inspection photos searchable by image. Arabic-first operations documentation. Air-gapped option for critical infrastructure.

WHY SEEKRA

Six honest differentiators.

No fabricated customer logos, no inflated statistics. These are the structural advantages Seekra delivers — verifiable on day one of a pilot.

01

100% self-hosted

Runs on your infrastructure, including fully air-gapped deployments.

02

PII masked at the source

Names, ID numbers, emails, and phone numbers are automatically redacted. In air-gapped deployments the AI model itself runs locally — no data and no model ever leave your infrastructure.

03

Cited answers with page-level deep links

Every claim in an answer links to its source page in the built-in viewer.

04

True multimodal search

Text, image, and voice in one system — not three separate products.

05

Arabic / English parity

First-class Arabic with proper RTL and font shaping. Not a translated afterthought.

06

One workspace, no friction

Built-in viewer for PDF, Word, Excel, PowerPoint. No “download and open locally” round-trip.
